< Millennials' purchasing behavior toward fashion clothing brands: influence of brand awareness and brand schematicity/>

t003328 Introduction The worldwide fashion apparel market , worth US\$ trillion , makes up % of the global gross domestic product and employs m textile workers , an increase from . m Millennials ' purchasing behaviour over the previous years . In a similar vein , a report from Clothing stores also acknowledged that the global revenue in the fashion retailing reached \$ . trillion in and is expected to grow by % by . Despite the growth \*\*\*LOADED and importance of fashion retailing , only a limited number of studies focus on customers ' attitude related to the fashion clothing brands . Therefore , it is essential to understand the brand-related consumers ' purchasing behavior more deeply to accelerate the industry performance \*\*\*LOADED . The current research has considered millennials , young consumers , born between and . As empirical investigation reveals , globally the millennials represent the largest generational population , and their purchasing power is making them an attractive target for the fashion clothing brand industry . The segment also represents a significant portion of global fashion retail consumption . Research shows that the millennials are an exceptional cluster who are young , affluent , educated , tech-savvy and inclined to a positive social behavior . However , academic literature has so far failed to acknowledge the connection \*\*\*LOADED of the significant attributes that affect how the millennials purchase their fashion clothing brands . Although several studies explore

diverse consumers and their behavior in regard to the fashion clothing brands during the year – , none of the studies have looked at brand consciousness , brand awareness , brand nationality and brand schematicity in one framework \*\*\*LOADED to get more insights about the millennials ' purchasing behavior toward the fashion clothing brands . Authors refer to BC as the consumers ' mental orientation to purchasing well-known brand-name products , whereas BS is a result of the consumer socialization process which provides people with the " skills , knowledge \*\*\*LOADED and attitudes " relevant to consumption . Unique experiences with a particular brand influence socialization and may instill consumers with brand-based associations that serve as the cognitive schema and emphasize the value of brands in general . According to Keller , BA is the consumers ' ability to identify a brand under different conditions in the form of brand recognition and brand recall . Researchers \*\*\*LOADED claim that to attract new customers and retain the existing ones , firms need to distinguish themselves from their competitors . Previous studies also suggested that country image activates concepts and knowledge \*\*\*LOADED that form the consumers ' interpretation , are that evaluation of products are influencing the assessments of the existing brand . The literature also provides evidence that consumers ' knowledge \*\*\*LOADED of BN or origin may have a significant influence on their judgments of quality , brand attitudes and purchasing behavior in the respective marketplace . The contemporary researches also suggest that the fashion industry is comprehensive in nature and encompasses the continuous expansion of consumer 's understanding \*\*\*LOADED regarding the fashion trends , consumers ' lifestyle \*\*\*LOADED and cultural dimensions . As we see a lot of fashion brands in the marketplace , our purchase decisions follow a thorough evaluation , and thus consumers develop an emotional

relationship \*\*\*LOADED with brands . Therefore , we assume that the consumers assess a brand based on the cue of BA , BS , BC and BN ; however , there is scant empirical evidence on this topic . In our research context , the millennials who have a high BC of the fashion clothing brands believe that these brands reflect their personality . Besides , the millennials ' brand preferences \*\*\*LOADED have both a direct and indirect effect on the purchasing behavior of their families and peers . Thus , the primary aim of this research is to investigate MCPBFCB in the spectrum of BA , BS with BC and BN empirically . , Author Research context Focal construct Research design Major findings

value and sustainability knowledge \*\*\*LOADED have significant effect on a consumer 's attitude toward sustainable clothing products Table . Millennials ' purchasing behaviour This paper starts with a literature review and formulates the research hypotheses along with the development \*\*\*LOADED of a conceptual framework \*\*\*LOADED , followed by the methods , experimental findings \*\*\*LOADED and reporting on the technical and managerial \*\*\*LOADED entanglements . Finally , this paper concisely discusses the research limitations and the prospective research direction . Literature review and hypotheses development \*\*\*LOADED Fashion is an activity \*\*\*LOADED whereby an individual expresses personal tastes and interests through clothing . The conceptualization of fashion is considered an objective reflection of behavioral processes through which consumers present their lifestyles \*\*\*LOADED . Fashion clothing is identified as a highly animated product category that communicates the related brand preference \*\*\*LOADED and reflects the consumer 's self-image . Research on fashion has received particular attention in the field of fashion marketing \*\*\*LOADED and brand management \*\*\*LOADED . Fashion is an innovative industry with dynamic changes that result from technological advancements . Prior research has extensively studied various dimensions to explain a consumer 's behavior toward the fashion clothing brands . The Table presents a summary of the selected studies on the fashion clothing brands . To identify the existing research , we searched the databases of Scopus , Web of Knowledge , Business Source Complete , Emerald and ScienceDirect with the keyword " fashion clothing brand " . As depicted in the Table , the marketing \*\*\*LOADED scholars mostly emphasized understanding the consumers ' fashion buying behaviors for various segments Research context Focal construct Research design Major findings \*\*\*LOADED Miao Understanding different fashion retail

store formats of the same brand in what extent and how affect consumer 's satisfaction and loyalty Store environment , satisfaction , attitudinal loyalty , behavioral loyalty Cross-sectional survey with samples Attitudinal loyalty directly influences behavioral loyalty , and satisfaction indirectly influences behavioral loyalty through the mediating effect of attitudinal loyalty Jain Understanding the effect of consumers subjective norm on luxury purchase intentions of General Y consumer Attitude , subjective norm , perceived behavioral control and purchase intention Cross-sectional survey with samples Subjective norm positively influences luxury purchase intentions of a consumer Jain and Mishra Understanding \*\*\*LOADED luxury fashion consumption in the perspective of sharing economy Economic benefits , fashion involvement \*\*\*LOADED , self-pleasing experience , social projection , perceived risk , past sustainable behaviour and intention to consume luxury in sharing economy Cross-sectional survey with samples Social projection value is found as the significant predictor of intention to consume luxury fashion on a sharing basis Table . Source : Author 's analysis , millennial , Generation Y ) . Furthermore , literature streams also reveal that no prior study on the fashion clothing brand highlighted the role of BA and BS together to understand a consumer 's purchasing behavior . On the other hand , BS is a relatively new way to understand the individual differences in processing the brand-associated information that substantially impacts the branding and marketing efforts . We take into consideration this phenomenon of individual differences or BS . The primary aim of this paper is to critically analyze the role of BS to understand the purchasing behavior of the millennials . Despite the importance of understanding consumers ' brand processing information at the individual level , to the best our knowledge \*\*\*LOADED there has been no empirical evidence on

whether BS has a role in predicting MCPBFCB . Therefore , in the present study , we examine the role of BS on the MCPBFCB while considering BA , BC and BN in a single framework \*\*\*LOADED as depicted in the Figure . In this study , we also acknowledge the theory of cognitive self-schema . This theory explains an individual 's psychology based on the perception of information that humans develop over time and how that built up information drives decision-making . An individual 's positive self-schema plays a moderating role in converting intentions to actual behavior and therefore helps researchers \*\*\*LOADED understand the gap between intention and behavior . According to Samala and Singh , the schema knowledge \*\*\*LOADED helps to create a particular behavior by highlighting the default choices or the attractive attributes . In this study , researchers \*\*\*LOADED tried to identify more attributes that the millennials take into consideration when buying the fashion items . Note :

MCPBFCB : Millennial purchase behavior ; BC : Brand Consciousness , BN : Brand Nationality , BA : Brand Awareness , BS : Brand schematicity H Brand Awareness Millennial 's Purchase Behavior Brand Nationality Brand Consciousness H H H H Brand Schematicity H H H H H Figure . MCPBFCB embedded with the function of BA , BC , BN and BS Millennials ' purchasing behaviour BA and purchasing behavior BA is a fundamental driving force for the consumer decision-making . The consumer decisionmaking for products or services is highly driven by the associated BA , which refers to whether or not consumers can recognize and recall a brand under various circumstances . Though BA and brand recognition are used interchangeably , brand recognition , along with brand recall , are two pivotal dimensions that illustrate BA . Brand recognition is based upon an aided recall where consumers can recognize the brands from a given list based on their prior exposure , and brand recall relies on an unaided recall where

consumers retrieve brand information from their memory based on industry prompts . The first name that comes into a consumer 's mind when asked is an example of BA at the highest level . BA is a presence already formed in the mind of the consumers . BA acts as a primary driver that initiates the building \*\*\*LOADED of brand resonance , and the demand for a brand is created by the level of a consumer 's BA in addition \*\*\*LOADED to the role of decision heuristics which significantly influence a consumer 's decision-making . The fashion clothing brands are distinctively experiential , and a consumer 's experience is shaped by building confidence and connection \*\*\*LOADED , which leads to forming an increased BA . The increased BA creates loyalty and long-term customer relationship \*\*\*LOADED opportunities for brands and their consumers . BA plays a pivotal role in establishing recognition of the fashion clothing brands among young consumers , positively affecting their brand equity . The most recognized model for the consumer purchase decision-making , corroborated by Engel et al. , presents five stages of the consumer decision-making process , where the consumers ' purchasing behavior is different from the purchase intention . Morrison first distinguished between the purchase intention and the purchasing behavior where the purchase intention is the willingness of the consumers to buy a product and the purchasing behavior portrays whether consumers purchase the product they previously intended to buy . So , the purchasing behavior indicates the consumers ' actual buying behavior . The consumer purchase intention has been used as a proxy variable to measure the consumer buying behavior , but the consumer purchase intention does always lead to the actual purchasing behavior . Much of the more significant part of the literature on BA from different contexts investigated the association between BA and purchase intentions in the fashion clothing

industry . There is a relatively small body of literature that is concerned with the link between BA and purchasing behavior . Huang and Sarig€ollu € empirically exhibited the positive connection \*\*\*LOADED between BA and consumers ' preference \*\*\*LOADED for a brand , followed by the brand market outcomes . Consumers form behaviors directly from a situational or environmental circumstance , and the more consumers experience a product , the more the awareness for that brand grows , which stimulates the consumer purchasing behavior . For the fashion clothing products , a consumer 's degree of involvement \*\*\*LOADED in fashion clothing positively influences the consumers ' fashion clothing knowledge \*\*\*LOADED , or brand knowledge \*\*\*LOADED , thus increasing BA . The consumers with fashion BA are pioneers with the significant brand knowledge \*\*\*LOADED who put a great deal of emphasis on specific fashion clothing brands by searching and collecting the necessary information about them . This enables them to become influential in promoting the fashion clothing brands to their peers . Conversely , only a high-level BA is sufficient to influence a consumer 's decision-making process in the low-involvement situations as in those situations consumers rely on the brand , knowledge \*\*\*LOADED associated with BA . Therefore , we hypothesize that the higher the BA , the more it will influence MCPBFCB . H . BA has a positive influence on the MCPBFCB . BC and BA BC is the degree to which a consumer prefers to buy a popular brand 's product compared to the other available brands and also the level of association consumers feel toward the respective product . So , the consumers who are brand conscious prefer to buy the branded products . Consumers with a high level of BC perceive that brands portray a symbol of prestige and status . Conscious consumers do not want to disengage from the fashion trends as their clothes communicate status and

tastes . In a recent study , Kautish et al. exhibited that the consumers ' terminal and instrumental values associated with the luxury brands positively influence the consumers ' BC particularly for fashion apparels . The fashionable clothing brands represent the self-image enhancement for consumers , motivating them toward luxury consumption to impress others through and establish a high social status . Moreover , as the proliferation of technology creates easy access to the online fashion retailers , this brings more convenience in shopping for consumers and positively affects their desire to revisit the site and enhances the consumers ' BC . Interestingly , the fashion clothing brand shoppers exhibit the highest level of BC . BC for fashion clothing is regarded as pivotal for the consumers who want to portray a prestigious , fashionable lifestyle \*\*\*LOADED . Prior studies examined the logo change effect on consumers ' attitudes , and only the consumers with a high BC put significant effort into processing the new information because they valued the changes in the brand attributes . Consumers are motivated to undertake this extensive effort because of their awareness of the brand through prior experience and the importance of the brand in their mind . It is hypothesized in this study that the higher a millennial consumer 's BC for the fashion clothing brands , the higher their BA of the fashion clothing products . H . BC has a positive influence on BA for the fashion clothing brands . BC and purchasing behavior The consumers who are highly brand-conscious seek quality products while making the purchase decisions , particularly in the clothing selection \*\*\*LOADED that requires both the quality fit and brand name . The brand-conscious consumers follow a comfortable pattern that drives them to go for the well-known and expensive choices that represent them with new styles rarely used by others . A great deal of previous research into the BC

has highlighted the positive influence of BC on the consumer purchasing behavior . The consumers who are brand-conscious possess a subjective preference \*\*\*LOADED toward the reputable brands ; thus , their purchasing behavior is different from the consumers with a minimal level of BC . The brand-aware consumers are fashion-conscious and display risk aversion in the purchasing decisions through their brand association . BC , along with quality consciousness , are identified as the key driving factors \*\*\*LOADED in the consumer online shopping behavior . BC exposes the underlying intention of the consumers to purchase the brands which are analogous to their self-image and identity and exhibit status and prestige . In a recent study , Sharda and Bhat articulated that BC is a significant predictor and driver of young consumers ' consumption and purchase of the luxury brands . Therefore , BC shapes the Millennials ' purchasing behaviour consumer purchasing intention which ultimately leads to the actual purchasing behavior . Thus , this study hypothesizes the following : H . BC has a positive influence on the MCPBFCB .

BN , BA and purchasing behavior The proliferation of the Internet and globalization has brought the world of information to our finger tips , which enables consumers to be updated about the latest fashion trends of different countries and celebrities . BN is also known as nation branding , which refers to the distinctive blends of elements with diversified dimensions that provide a nation differentiation and association from a cultural perspective for its target audiences . Brands put extensive effort into crafting and positioning a brand 's identity in the mind of consumers by familiarizing and inspiring consumers nationally and internationally . The nation branding exposes a considerable set of connotations about a nation that is activated in a consumer 's mind through what he/she experiences , listens \*\*\*LOADED to and remembers .

The brand of a nation is reflected through its image , values and identity and the communication of those factors \*\*\*LOADED to the external world so that the consumers of other nations build positive perceptions toward that particular nation . The country of origin , destination branding , country-product image and country identity all underpin the nation branding concept . We assume that the country-product image is pertinent in our study context . The country image is an effective evaluation of the existing products along with an assessment of the new products from that country , as well as an acceptance of the foreign products . The brands built upon the country image affect the consumer product evaluations by evoking positive or negative feelings \*\*\*LOADED followed by positive or negative ratings which indeed lead to favorable or unfavorable product preferences \*\*\*LOADED . Consumers have the perception that the products from the developed countries are much better produced and manufactured \*\*\*LOADED . The brands that are associated with a perceived high-quality country image are already positioned and recognized in the mind of consumers , which positively influences the consumer risk-value perceptions and the willingness to experience the product . Because of this BA and BN , consumers will favorably evaluate the new products and brand line extensions from the same country . Therefore , we hypothesize that the higher the BN of the fashion clothing brand , the higher the BA of their fashion products . H . BN has a positive influence on BA of the fashion clothing brands . BN brings a positive influence on the consumer purchasing decisions as consumers believe that a product 's or service 's origin delivers quality . Certain consumers have firm affinity toward the foreign products , and this buying intention has become a priority for the global marketers . These same marketers experience a high corporate competition as they try to achieve global market expansion . Early

examples of research on the nation branding emphasized that the practitioners should assess the consumer purchasing behavior with the product-country match information , which will lead to formulating their product branding strategy .

The nation branding with a favorable product-country image has an immediate effect on consumer beliefs and directly influences their purchasing behaviors .

Nation branding is an indispensable attribute , unlike price – quality , that directly affects the consumer purchasing behavior by simplifying the product evaluations and decision-making process . The nation branding acts as an extrinsic cue for the consumer product evaluation and the subsequent purchasing behaviors . Thereby , we hypothesize the following : , H . BN has a positive influence on MCPBFCB .

Mediating role of BA We theorize that BA exerts a mediated influence on the consumer purchasing behavior involving BC and BN . At the time of purchase , the first thing that comes into a consumer 's mind is the brand title or name , which shows the BA and brand recognition . Despite the direct effect of BC and BN on the consumer purchasing behavior , we expect BA to transmit the impact of BC and the BN indirectly on the consumer purchasing behavior .

Previous research examined the mediating role of BA between the consumers ' emotional dimensions and purchase intentions for the high-involvement products . Garg et al. exhibited the significant mediating role of BA between the marketing-mix elements and the consumers ' satisfaction in the context of the consumer durable goods sector . The mediating role of BA was also examined in another study to understand the effectiveness of brand advertisement on brand commitment in the female apparel industry . Asadollahi et al. investigated the relationship \*\*\*LOADED between the sports consumers ' satisfaction and the expected product-service quality with post-purchasing behavior and the mediating role of BA . In a recent study , Hafez articulated

the mediating position of BA between corporate social responsibility and brand equity . However , the role of BA as a mediator between BC and purchasing behavior followed by BN and purchasing behavior is rarely explored in the context of fashion clothing brands . Therefore , this study postulates the following hypotheses for further empirical assessment : H . BA mediates the relationship \*\*\*LOADED between BC and the MCPBFCB . H . BA mediates the relationship \*\*\*LOADED between BN and the MCPBFCB . BS The role of branding has a significant impact on understanding consumer behaviors . The consumer–brand relationship \*\*\*LOADED has been extensively researched in the field of marketing \*\*\*LOADED , with a finding \*\*\*LOADED that some consumers respond in the same manner to a firm 's branding activities \*\*\*LOADED , whereas other consumers are either brand-schematic or brand-aschematic . BS is an individual characteristic that says that the brand-schematic consumers process information for any product in reference \*\*\*LOADED to its available brand information , whereas the brand-aschematic consumers consider other details instead of brand information . Commercially positioned brands get prioritized by the brand-schematic consumers , and across all product categories this BS can be applied . The brandschematic consumers organize , interpret and retrieve consumption-related information at the level of the brand node . Moreover , the brand-schematic consumers value the brand which is essential to them . Brand information is perceived diagnostically by the brand-schematic consumers , and they adopt the schema-related dimensions to evaluate and criticize the brand-related news . Prior research examined the relationship \*\*\*LOADED between the aesthetic brands and the brand accessories \*\*\*LOADED with the moderating role of BS . Carsana and Jolibert exhibited the moderating role BS in purchasing situations have on the product cues perceived

necessary by the consumers . In a recent study Carsana and Jolibert explored the influence of BS on the brand authenticity in respect to the private-level brands . They found that the brand-schematic consumers perceive the brand authenticity dimensions that are favorable , and the BS also increases the consumer willingness to pay for the private-level brands . In our research about Millennials ' purchasing behaviour the fashion clothing brands , consumers process extensive information in all the brandassociated settings : BN , BC , BA and subsequently MCPBFCB . Consumers who are receptive deliberately receive , store , interpret and retrieve brand information for the decision-making purposes . Therefore , the individual differences in brand information reflect the impact of the branding efforts , purchasing behavior and overall consumer behaviors . We posit that BS has a moderating role in our research context and hypothesize the following : H . The higher the consumers ' BS , the higher the positive effect of BC on the MCPBFCB . H . The higher the consumers ' BS , the higher the positive effect of BA on the MCPBFCB . H . The higher the consumers ' BS , the higher the positive effect of BN on the MCPBFCB . Therefore , based on the above discussion \*\*\*LOADED , the following conceptual model for this empirical study explains the relationship \*\*\*LOADED between fashion clothing BA and MCPBFCB by considering BC and BN , along with investigating the role of BS as a moderator between MCPBFCB . Research methods The study used the structural equation modeling method for analysing the proposed conceptual model as it was more flexible concerning the data requirements , model complexity and relationship \*\*\*LOADED specifications . To perform the statistical analysis , the software packages AMOS and SPSS were employed . Before executing the test of hypotheses , the data for assessing the connected constructs , collected through the survey , were verified to check

for reliability and validity . The study adopted the Cronbach 's  $\alpha$  and the confirmatory factor \*\*\*LOADED analysis to assess the reliability and the robustness of the instrument , respectively . Besides , the research also used the metrics such as composite reliability , the average variance extracted and loadings to test the instrument 's reliability and validity . Data collection \*\*\*LOADED and sample profile The study applied self-administered questionnaires by using the shopping mall and university campus intercept procedures , similar to Hossain et al. . The current research adopted a convenient sampling process to generate a substantial amount of respondents \*\*\*LOADED to conduct the current research . This study used the millennial consumers in Bangladesh born between the years and , aged – years at the time of the data collection \*\*\*LOADED period . The study collected the data over a -week period including both the weekdays and the weekends , measuring the millennial consumer 's purchase behavior toward the fashion clothing brand in the shopping-related environment and the university campus environment that allowed the population of interest to relate to what the research intends to investigate by this empirical study . Hence , during the data collection \*\*\*LOADED period , the research applied the snowball sampling process to use the subjects to identify another issue among their acquaintances , aged – . Well-trained research assistants were used to do the data collection \*\*\*LOADED . The survey instrument was designed to take the respondents \*\*\*LOADED not more than min to complete . The survey started with the screening questions to verify that the respondents \*\*\*LOADED met the criteria of the survey . Afterward , the constructs were included to measure the possible predictors of MCPBFCB – namely , BC , BA , BN and BS . The survey also concluded with the demographic questions . Each of the constructs was measured using a five-point

Likert scale , with being strongly agree and being strongly disagree . The detail of the demographic characteristics is given in the Table . , Construct operationalization and data analysis method The survey instruments were constructed based on some of the validated scales used in previous studies . The constructs were measured using multi-item scales . To investigate MCPBFCB , the study adapted the existing scales : BC , adapted from Giovannini et al. ; BN , adapted from MohdYasin et al. ; MCPBFCB , adapted from Caruana ; BA , adapted from Yoo and Donthu and BS , adapted from Zarantonello and Pauwels-Delassus . Common method variance Common method bias , in the context of SEM-oriented research , is brought about by the estimation technique utilized in the examination and not by the system of circumstances and results in the model being considered . For example , the rules at the start of an instrument may impact the appropriate responses given by various subjects in a similar general course , making the markers share a specific measure of common variation . The current research has spent considerable time measuring the common method variance effect in the design of studies and statistically . In the context of research design , researchers \*\*\*LOADED improve scale items by eliminating ambiguity , reducing social desirability bias , word selection \*\*\*LOADED and the use of positive and negative elements . In this aspect , the current study carefully constructs the items by defining the unfamiliar terms , avoiding vague concepts and clarifying the concepts to the respondents \*\*\*LOADED during the survey , making the instrument simple , specific and concise and avoiding double-barreled questions . Also , we applied the Harman 's single-factor Characteristics Total Percentage Gender Male % Female % Age Male . Female . Permanent residence Dhaka % Chittagong % Rajshahi % Mymensingh % Barisal % Khulna % Sylhet % Rangpur % Education College student % Bachelor 's

student % First year master 's student % Money spent on clothing a month \$ or  
 less % \$ -\$ % \$ and above % Table . Demographic characteristics of the  
 respondents \*\*\*LOADED Millennials ' purchasing behaviour test by using the  
 exploratory factor \*\*\*LOADED analysis procedure for all the datasets . The  
 results revealed that the single-factor solution accounted for only . % of the  
 total variance . Hence , common method variance was not a concern in this study  
 as the common method bias is insignificant . Therefore , the study can proceed  
 to the CFA and hypothesis testing . Research findings \*\*\*LOADED CFA and  
 assessment of validity and reliability CFA was performed on five constructs ,  
 including BC , BN , MCPBFCB , BA and BS . We used the maximum likelihood  
 estimation in AMOS in the data analysis prior to incorporating the structural  
 relationship \*\*\*LOADED . The current research assessed the measurement  
 \*\*\*LOADED model through the criteria of unidimensionality , reliability ,  
 validity and normality . Data achieve unidimensionality when all the items  
 under each construct have acceptable factor \*\*\*LOADED loadings that are  
 greater than . . Reliability is the degree to which the things are dependably  
 estimating the expected latent construct . The current study examines the  
 reliability with the criterion of the Cronbach 's alpha value under the  
 paradigm of more than or equal to . . The outcomes of the unidimensionality and  
 dependability investigation for all the constructs are displayed in the Table .  
 The study also tested the data to fit with the validity criteria which assess  
 the ability of a construct to measure what it is supposed to measure . In this  
 study , convergent and discriminant validities were examined for each construct  
 . For testing the convergent validity , the composite reliability value must be  
 more than or equal to . and the average variance extracted value must be more  
 significant than or alike . . The result from the data revealed that all the

constructs had fulfilled these two requirements . In addition \*\*\*LOADED , the study tested discriminant validity by the square root of AVE for each construct , which should be higher than the correlation coefficients among the constructs . The statistical results also passed this threshold . The results from the CFA analysis suggested that the chi-square value at degrees of freedom is . which is less than or equal to . suggesting a satisfactory model fit . In addition \*\*\*LOADED , the study also tested other assessment measures to examine the model fit indexes such as the goodness-of-fit index , adjusted goodness-of-fit index , the comparative fit index , the Tucker–Lewis index and the root-mean-square error of approximation . Thus , the result from the CFA analysis concluded that the data fit well on the proposed model . The study then examined the psychometric properties of the measurement \*\*\*LOADED model through validity and reliability tests . The results from the analysis revealed that all the standardized factor \*\*\*LOADED loadings of the items for the underlying constructs are all significant at the . level and entirely suggest evidence of convergent validity . In addition \*\*\*LOADED , the Table also highlights the result of the reliability and validity tests for evaluating the measurement \*\*\*LOADED model . That is , each item strikes the component of the intended construct significantly . The current study calculates construct reliability , AVE , Cronbach alpha , maximum shared variance and average shared variance . The study shows that the value of CR and the Cronbach alpha of each construct meet the requirement as well as the convergent validity . In this study , the researchers \*\*\*LOADED performed the MSV and ASV to support whether the theoretical construct of the measurement \*\*\*LOADED model is well defined or not . According to the Fornell and Larcker index , higher values of AVE compared to the shared variance amongst the square of correlations in terms of

pairs of constructs validate the discriminant validity . The result of the MSV and ASV should be lower than . to indicate a valid model . By inspecting both the ASV and MSV , the result suggests that the measurement \*\*\*LOADED model is indeed valid . As , highlighted in the Table , the AVE for each construct is greater than all the related correlations , thus indicating discriminant validity .

Structural model After confirming the validity and reliability of the data , the study tested the SEM to measure the hypothesized relations of BA , BC , BN and millennials ' BC toward MCPBFCB . The SEM analysis is similar to the study of Rahman et al. . The model was checked for the fitness , and the results were satisfactory in respect to  $\chi^2/df$  . ,  $p < .$  ; GFI . , AGFI . , CFI . , TLI . , and RMSEA . . The fit indices all meet the suggested statistic cut-off values.

Hypotheses testing Each hypothesized relationship was examined based on the path significance test. The H<sub>1</sub> proposed that the BC has a positive influence on the MCPBFCB. The results showed that BA significantly influence the MCPBFCB . Thus, the H<sub>1</sub> was First-order construct Item Factor loading Cronbach's alpha CR AVE BC BC BC BC BC BC BC . . . . .

Results of unidimensionality , reliability , convergent validity and discriminant analysis Millennials ' purchasing behaviour supported .

Additionally \*\*\*LOADED , the H<sub>2</sub> predicted that BN has a positive influence on

MCPBFCB . The results from the SEM found that a significant relationship \*\*\*LOADED exists between these two variables . Therefore , the research supports the H and H . To further test the mediating effect of BA between the relationships \*\*\*LOADED of BC and MCPBFCB , as well as between BN and MCPBFCB , the study applied Baron and Kenny recommended procedure . A significant amount of research has applied the mediation testing suggested by Baron and Kenny . In addition \*\*\*LOADED , in the context of fashion marketing \*\*\*LOADED research , the application of a mediation analysis using the logic suggested by Baron and Kenny has also been observed in the literature . A variable may function as a mediator when it meets all the following three conditions : The independent variables significantly influence the mediating variable ; The mediating variable significantly affects the dependent variable ; and When paths a and b are controlled by the study , a previously significant relation between the independent variables and the dependent variable is no longer meaningful . In that regard , we hypothesized that BC and BN would have a positive influence on BA among MCPBFCB . The results show that both the variables have a significant influence on BA . Thus , the H and H are supported . The H states BA has a positive influence on MCPBFCB . A significant positive effect was found from the data analysis that justifies supporting the H . Hence , the H is supported . Following Baron and Kenny recommendation to test the indirect effect of BA between the relationship \*\*\*LOADED of BC and BN , the direct impact of each relationship \*\*\*LOADED was examined and proved significant . After introducing the mediator variable , the paths became insignificant , indicating that both the variables are fully mediated by the BA . Afterward , we tested separately the idea that the BA demonstrated the stronger mediating effect on BC and MCPBFCB than on the relationship \*\*\*LOADED

between BN and MCPBFCB . Based on the above findings \*\*\*LOADED , the current research supported the H and H . The Table summarizes the results for the moderating role of BS . We also found significant interaction effects of the moderators among the three relationships \*\*\*LOADED . The low and high values of BC , BN , BA and moderator variable BS represent values that are one standard deviation below and above the mean , respectively . For the dataset of the millennial consumers ' purchase behavior for the fashion clothing brands , the interaction between BC and BS was significant . The simple slope analysis revealed that BC is positively related to MCPBFCB when the millennials perceived a high level of BS . Thus , this research accepted the H , which shows that the higher the consumer BS , the higher the positive effect of BC on MCPBFCB . To test the interaction hypotheses of the H , we first standardized the independent variables and then created the product variables . In this process , the results from the SEM analysis revealed that the interactions between BS and BA were significant . Thus , the higher the consumer BS , the higher the positive effect of BA on MCPBFCB , as shown in the Table . Therefore , the current research supports the H Also , the simple slope analysis revealed that BN was positively related to MCPBFCB when BS was positive and on a high level . These , results support the H . Besides , the results also reveal that the model fit for each interaction effect analysis is in the threshold level for the final moderated model . The major objective of the current research was to examine the theoretical model proposed by the study and prove the empirical relationships \*\*\*LOADED among the constructs . The SEM result revealed that the proposed conceptual model predicts the millennials ' purchasing behavior in light of BC , BN and BA , with BS in support . The following section explains the overall findings \*\*\*LOADED of the research based on the proposed

hypotheses . Discussions \*\*\*LOADED The millennials ' purchasing behavior has been studied extensively in recent years for various product or service segments : cosmetics , apparel , technology , tourism and so on . Different generations portray distinctive and dynamic behavioral dimensions , so the millennials is an interesting group to study because of the millennials ' unique characteristics and high BA . The existing body of research has demonstrated to a great extent the consumers ' behavior in association with BA , BC and BN . Analyzing MCPBFCB can help the marketers and the designers \*\*\*LOADED to understand consumers ' needs and desires in regard to the fashion clothing brands thereby helping them to focus on taking steps to reform their brand-related marketing \*\*\*LOADED strategy . In this study , we tested whether BC , BN and BA foster MCPBFCB . In addition \*\*\*LOADED , the current research also investigates the direct and indirect links between the millennial consumers ' concern of BC and BN , as well as the mediating role of BA . Drawing on previous research , the data from these findings \*\*\*LOADED support the effect of BA and show how it mediates the relationship \*\*\*LOADED . In particular , BA reconciles the path from BC and BN to MCPBFCB . This SEM result also indicates that MCPBFCB is not just a matter of quality , promotion , pricing and distribution . In fact , and to an even greater extent , it shows the importance of BC

Note : MCPBFCB : millennial

consumers' purchase behavior for fashion clothing brands ; BC : brand consciousness , BN : brand nationality , BA : brand awareness , BS : brand schematicity Table . Results of moderation analysis Millennials' purchasing behaviour and BN and the overall BA among millennials . Based on the analytical results , BA actively mediates BC and MCPBFCB , in addition \*\*\*LOADED to the BN and MCPBFCB relationship \*\*\*LOADED . This relationship \*\*\*LOADED supports previous research which argued that consumers are conscious of brands before they make a repeat purchase . This finding \*\*\*LOADED also indicates that BA in the context of fashion clothing brands is an influencing factor \*\*\*LOADED between BC and millennial consumers for fashion clothing brands within the competitive fashion clothing market of Bangladesh . Besides , we investigated the moderator role of BS in the relationship \*\*\*LOADED between BC and MCPBFCB , BN and MCPBFCB and BA and MCPBFCB . We found that all of the MCPBFCB variables are significantly influenced by BS . For individuals with a low propensity to BS , BC , BA , and BN had no effect on MCPBFCB . The interaction effect observed was significant even after controlling for relevant demographics , namely gender . Theoretical implications Considering that marketing \*\*\*LOADED and consumers' buying behavior are firmly related , the influencing variable of one on the other in the actual buying behavior of consumers is intriguing . This investigation contributes to understanding the behavior of millennials , which is a significant profitable segment for the fashion retailers . The theory of cognitive schema portrayed in this research showed how knowledge \*\*\*LOADED about the particular fashion brand is formed and conceptualized in the target customer's mind when deciding to buy . The application of this theory was limited in most of the prior research . However , the implication of it is significant because of how consumers process

information and decide to buy something for themselves . The inner structure of schema stays stable across overdesigned spaces , and that enables the analysts to regard schematic properties as vital parts of the equivalent hypothetical framework \*\*\*LOADED that can be adequately connected in various settings and related to different ideas . The results of the study empirically contribute to the existing literature of millennial purchasing behavior through a cognitive self-schema theory . The uniqueness of the study is examining the concepts of BA , BS , BC and BN under the cognitive schema theory paradigm . Besides , this research is one of the first efforts in the context of Bangladesh 's millennial consumers to identify the significant antecedents such as BA and BS that change the relationship \*\*\*LOADED between BC , BN and MCPBFCB . Previous research has emphasized almost exclusively the role of experience , perceptual maps , consumer status , brand engagement , brand involvement \*\*\*LOADED and brand knowledge \*\*\*LOADED on millennial purchasing behavior . Our findings \*\*\*LOADED contribute to the literature on brand management \*\*\*LOADED and consumer research by demonstrating that MCPBFCB is significantly influenced by BC and BN , with the presence of BA as mediation and the role of BS as a significant moderator among all the direct relationships \*\*\*LOADED . Managerial \*\*\*LOADED implications From the managerial \*\*\*LOADED point of view , this research explains MCPBFCB embedded with the function of BA , BC , BN and BS . The study confirms that the fashion clothing brand marketers should utilize potential opportunities of accessible social media technology such as Facebook and Twitter to create BA and brand preference \*\*\*LOADED among this group and establish future preferences \*\*\*LOADED and possibly brand loyalty toward their fashion clothing brand . In order to capture different consumer segments , Kautish and Sharma argue that the most effective and convincing promotion

strategy may be required by the online fashion clothing brands for creating a judicious mix in the minds of the target consumers . , In addition \*\*\*LOADED , marketers should apply both online and offline advertising in developing BA of fashion clothing brands as millennials are a niche market segment but extremely attractive for retailers . Therefore , the current research also suggests that for influencing their purchasing behavior , the marketers need to understand trends that may assist them in clarifying their sensitivity and awareness toward local and international fashion clothing brands . Millennials are growing up in an environment where technology provides a platform for personalization and immediate gratification in all aspects of their life . Therefore , the marketers should continuously update their online content and train their managers \*\*\*LOADED to effectively use social network sites to respond immediately to the millennial demands of fashion clothing brands . The results from this research also support the idea that millennials are brand-conscious and thus have significant brand loyalty toward fashion clothing brands . The results indicated that the millennials who have a high level of BC are more concerned about BA information to inform their purchasing behavior . Considering the substantial branding efforts of fashion clothing brand outlets , our research could be invaluable to the practitioners . For example , as the findings \*\*\*LOADED show , the role of BS is high among the relationships \*\*\*LOADED . Thus , millennial shoppers are progressively distracted with brand data and subsequently can be reached by online and offline advertising that publicizes the fashion clothing brands rather than their attributes . In contrast , the brand-aschematic purchasers likely are persuaded more by product attribute-oriented information . Moreover , BS can speed up information processing and influence judgment regarding BC , BA and BN . This provides

efficiently an accessible measure of the millennials ' purchasing behavior because it enables the consumer to make the best choice among the other fashion clothing brand alternatives . The results of this study show that information is vital to millennials when choosing the right fashion clothing brand . The result from this present research provides a new perspective that addresses \*\*\*LOADED millennial customers ' interaction not only through physical experience but also through virtual technology during their offline and online shopping experience . The fashion clothing brand managers \*\*\*LOADED can focus on brand-schematic cues by providing consumers with various information such as leaflets that explain a commercial brand 's origin and value of the fashion clothing brand . Therefore , consumers should also be provided with technology-mediated tools which they could scan for data about different rational cues before picking their fashion brand . A brand-schematic buyer \*\*\*LOADED may be roused to find and store information about the brands that reference \*\*\*LOADED members ' use or even utilize the brand pattern to frame group inclinations . In this way , BS can be an active retail strategy that has critical ramifications for MCPBFCB . As the fashion clothing products are directly connected to brand consumer perception , advertisers should concentrate on those brand-related cues to draw the attention of millennials . A consumer with a higher BS displays more concern of BC , BA and BN . In this way , marketers ought to improve consumers ' knowledge \*\*\*LOADED of a fashion clothing item by dispersing important brand-related information in well-known media . With these innovations , the brand marketers can gain strong associations with the millennial consumers . To further build their status with the millennial consumers , the marketers should utilize imaginative exercises like customized data , promotions and referral projects to build the customers

' BC and BA and increase the knowledge \*\*\*LOADED of national and international brands , which in turn will increase the millennials ' advocacy and purchasing of their favorite fashion clothing brands . Limitations of the study and future research The findings \*\*\*LOADED of this study contribute to the field of consumer research in a particular segment as well as fashion clothing brands . However , similarly , as with any Millennials ' purchasing behaviour exploration , several limitations exist inside the setting of this empirical research . The principal confinement originates from the sample and extent of the investigation . Though the current sample is justified statistically , this sample may not apply to the entire population . On the other hand , if the information accumulation could cover a more extended timeframe and have a more significant sample estimate , the representativeness of the sample could be improved and the findings \*\*\*LOADED generalized . The impact of different factors \*\*\*LOADED like consumer feelings \*\*\*LOADED , emotions , customer service , store condition and retailer qualities were not considered in this investigation . Thus , future research may focus on these aspects as well . The proposed model was developed to study how the millennial 's purchasing behavior is being influenced by BC , BA , BN and BS . The study suggests that future research may cover the dimensions of brand experience and brand-related stimuli to understand MCPBFCB . The current study has also been limited to a particular product only . Further research into other product categories such as luxury products , destination tourism , or even services , would add more meaningful findings \*\*\*LOADED into the brand literature .
